GEO-POLITICAL IDEAS

Development of political geography is primarily credited to German scholar Ratzel, who propounded organic state concept in his Social Darwinism comparing state with an organism with the potentialities of growing or dying. This approach of political geography though prevailed as practical approach during the first half of 20th century but it marks its sequential decline in the evolution of contemporary geopolitical equations. Counterbalancing Ratzel's idea, American scholar Mahan initiated geo-political ideas emphasizing that political importance and equations are outcomes of locations. His geo-political ideas were strongly enriched by his disciple British Scholar Mackinder. Like Mahan, Mackinder's geo-political

ideas were based on sea-power. However, he presented one of the most enlarged and applicable ideas in dynamic orientations. His geo-political ideologies are primarily derived from:

i) His research paper entitled 'Geographical Pivot of History'

ii) His textbook 'Democratic Ideas & Reality'

iii) His research paper entitled 'The Round World and Winning of Peace'.

He presented his first research paper in front of Royal Geographical Society, way back in 1904. As a young political geographer, Mackinder outlined the concept of natural fortress as the area that cannot be encroached upon by the sea routes. Identifying it as PIVOT AREA, he recognised it to be the region extensive between R. Volga to Siberia. which includes frozen mouths of the rivers

and non-navigable Arctic Ocean projecting highest potentiality to become the node of politico-economic growth of the world. Surrounding pivot area he demarcated inner CRESCENT or MARGINAL CRESCENT. It was demarcated from Manchuria to Scandinivia including N. Africa, SW, S, & SE Asia. Beyond inner crescent, he demarcated outer crescent or insular crescent including new world, southern Africa along with British & Japanese Islands. In this paper he also demarcated 'world island' that is the combined landmass of Eurasia and Africa that projected maximum share of land territory of world along with maxm population. This research paper marked the first major attempt of demarcating map of world in geo-political relevant territories. It was, therefore, given stronger support by

the geographic society encouraging Mackinder to enlarge his geopolitical ideas. In his subsequent empirical observations, he prominently identified growing significance of W^n Europe on economic front in dominating regulation of global trade and its reflection as German invasion on Zaj. Czar ruled Russia, Recognising him to mould his natural fork. In addition, 1917 October Revolution marking termination of rule of Russian king & establishment of Soviet Socialist Republic was integrated by Mackinder in his geopolitical ideas. In 1919, full-fledged text on his geo-political ideas called Democratic Ideas & Reality, he projected the term HEARTLAND. The heartland was defined as enlarged pivot integrating political expanse of USSR along

with its influence zone including Danube Valley, Polland, Tibet, China, Asia Minor (Turkey) and Persia (Iran). Enlargement of pivot area as heartland shrinked inner crescent with similar extension of outer crescent maintained. Giving recognition to German invasion, Mackinder identified that 'as the heartland can be intruded only via European Steppes, the Controller of Eastern Europe will control heartland thus world island & world'. His book also emphasized on projections of growth of heartland as the node of political, technological, cultural & economic growth of the world. His projections of 1919 practically evolved with the convincing growth of the former USSR registered to eventually evolve as global world power. It is in form of

'SSR that Mackinder marked his contribution in geopolitics as practically most relevant geo-political idea. This practicality was further added in the last major amendment attempted by the scholar in his research paper of 1943 — The Round World & the Winning Of Peace, where apart from maintaining heartland he introduced midland and lenaland. with mid-land, he attempted to give recognition to the growing collaborated capatalist capacity across North Atlantic to counter-balance dominating growth of heartland. Recognition of mid-land further added to the practical orientation of heartland concept. Moreover, he identified the presence of 'adversity-zones' both within heartland & mid-land collectively: recognising it as lena-land.

that was extensive from R. Lena via East Siberian Mountains to Bering Strait, Alaska and Western Cordilleras, making this geopolitical idea one of the most dynamic progressive and practically utilised example.

Facebook Group: Indian Administrative Service (Raz Kr)

date 14/05/2014

APPRAISAL OF HEARTLAND CONCEPT

Mackinder's geopolitical ideas both in terms of its dynamism & applicability in form of former USSR is considered to be one of the most appropriate and long followed geopolitical viewpoint. His projections about former USSR, incorporation of recognition of potential beginning of cold war makes his analysis based on elaborate empirical analysis rather than speculative work. Though his work remain valid till the existence of former USSR i.e. 1991 it was opened to wide spectrum of criticism way back in 1940s

Among the imp. points of criticism :=

(i) Use of MERCATOR'S PROJECTION

(ii) Ignoring the growth of air-power

(iii) Ignoring diversities in the demarcated heartland, are included.

Mercator's Projection → True Shape
↳ Distortion in Area

Facebook Group: Indian Administrative Service (Raz Kr)

The par-excellent 19th century map projection called Mercator's Projection forms the true shape projection. In this projection, E-W exaggeration near poles is matched with N-S exaggeration, showing higher latitudinal regions exceptionally large, though with true shape. Mackinder is criticised of using this projection to reveal the size of its heartland exceptionally big compared to its real size. Though the scholar is credited of adding dynamism to his geopolitical ideas till 1940s, he is criticised of safely avoiding air-power in his geopolitical analysis inspite of substantive development and utilisation of air power during World War II. Putting forth this point of criticism prominent modern geo-politician Sprout (1965) identified that Mackinder avoided air power to maintain the originally defined natural protected fort as the causative component in development of pivot or heartland. The strongest

critic to this heartland concept, however, was Spykman. He developed his entire theory of RIMLAND criticising heartland as 'area of adversity'

RIMLAND CONCEPT

In 1944, Spykman presented his elaborate geo-political ideas in the text entitled 'Geography of Place'. His geo-political ideas involved rimland which was derived on the criticism of heartland concept propounded by Mackinder. Spykman emphasized that the projected heartland is 'zone of adversities'. It only possess partial centrality on the map of world. The region includes unfavourable physiography & climate, general absence of arable land, absence of mineral & energy resources, complete isolation from the developed maritime route of global trade and

above all demographically sparse & ethnically primitive location. Such location clearly lacks in the possibility of registering economic growth, so its potentiality as heartland is completely imaginary. Based on this argument, Spykman outlined Rimland. It included Maritime Europe, Crude oil West Asia; agricultural, mineral & population nodes - South & East Asia, along with potential maritime zones of SE Asia, Combined to the outlined heartland. His rimland therefore projected near complete Eurasia making him conclude that 'the controller of rimland will be controlling Eurasia thus the world.' Inspite of the fact that his work was published way back in 1940s, with practically existing heartland as former USSR, he could not generate desired support or encouragement for his geopolitical idea. With disintegration of USSR, entire range

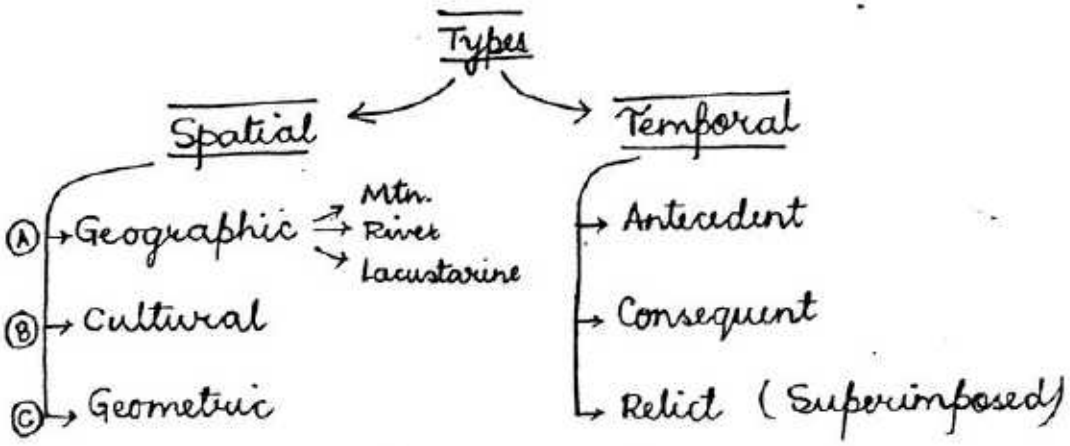

of adversities highlighted by Spykman became evident with most of Central Asian Countries (except Kazakhstan), some of European countries (Belarus, Maldova) and entire Siberian Russia lacks in favourable economic growth or momentum highlighted the reality of criticism projected by Spykman. Additionally, in the post-cold war era, single nodal world order involves the priority of Eurasia which acts as important RIMLANDS in terms of China, India, Russia and Gulf countries. In reference to geopolitical prominence reqd. to be maintained by USA, there is the compulsion of integrating Eurasian reimlands justifying Spykman's approach Rimlands oriented geopolitical equations have further become complicated with ever increasing demographic and economic capacity of China & India resulting in gradual shift

of global economic node towards East. Spykman's concept in geopolitics is one of the most referred concepts. However, it lacks in that absolute practical implementation as heartland concept was correlated to.

LAWS OF INTERNATIONAL BOUNDARIES/FRONTIERS

Geopolitically distinction is applied b/w nation and state wherein nation is projected to be more of feeling of belongingness and state with concrete political territory. Evolution of political map of world is largely denoted with development of nation paving way to development of state. In this transformation the buffer zone, no man's land, transitional zone - more prominently referred as frontiers paves way to boundaries. Boundaries are defined to be the line that bounds the political territory of states. On the political map of world, international boundaries depict

different characteristics which are analysed in categorising them into different types including :-

The geographic boundaries include the physiographic units in demarcating the political territories of neighbouring states. These boundaries involve mountains, rivers as well as lakes as significant examples,

i) The mountain boundary largely projects to be antecedent boundary that is existing prior to the development of distinguishing cultural identities. Moreover, mountain boundaries completely restricts possibility of cultural exchange & thus development of frontiers. Himalayas,

Andes, Pyrenees make excellent examples.

(ii) Active channels make examples of effective geographical boundaries. However, it marks its permanency and/or stability as per political relations shared by neighbouring countries. As example of consequent boundary the riverine boundaries project challenges in terms of its changing course & sharing of water. River Rio Grande, R. Paraguay - Parana, R. Orange, R. Amur make excellent examples of such boundaries.

(iii) The international boundaries in the consequent geographic boundary also include lakes and just like rivers the stability of such boundaries is dependent on political relations of neighbouring countries. Great Lakes (except L. Michigan) form the most stable example of lake boundary. However, both L. Victoria and L. Chad make the examples of disputed unstable boundaries.

among the other spatial categories, cultural boundaries overlaps with both consequent boundary and relict boundary. It represents sequential evolution of cultural ideologies resulting in development of new boundaries as political partition of USSR, Yugoslavia or results in termination of existing boundaries as boundary dividing Germany & Vietnam.

The relict boundaries that are eliminated existing political boundaries are largely correlated to the superimposed boundary that is not involving the aspirations or choice of population of that region.

The international boundary called Geometric are also largely consequent where the boundaries are demarcated in reference to graticule network. Most recognised example include 49° N (USA-Canada), 141° W (Alaska - Canada).

Though it is maximum of Africa that incorporates geometric boundary reflecting the division attempted by colonial settlers towards the end of colonial rule.

China - Russia : R. Amur

India - China : Mtn. (Himalayas)

Spain - France : Mtns. (Pyrenees)

R. Danube : Lengthiest of europe ; Int'l boundary B/w Romania & Bulgaria.

Great Lakes : Lacustarine (USA & Canada)

USA & Mexico : R. Rio Grande

Chile & Argentina : Andes (Mtns)

Namibia - S. Africa : R. Orange

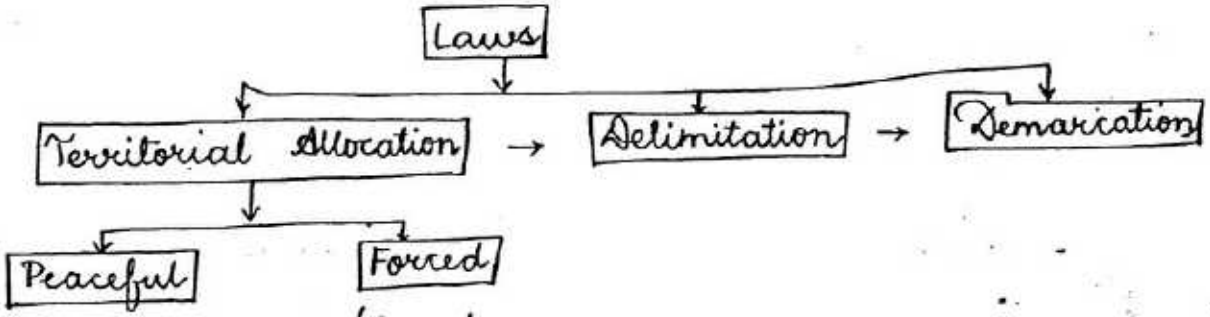

Niger, Chad, Nigeria : Lake Chad

Uganda, Kenya, Tanzania : Lake Victoria

LAWS

The laws of international boundaries are generalised to be commonly followed procedure in demarcating boundaries between the states. These generally followed procedures, however, is not applied to each and every political boundary evolved on the map of world. However in the absence of any written norms, these procedures are demarcated as informal laws.

These involve :-

Purchase

Quasi Judical Settlement / Arbital Award

Plebicite (Public Opinion)

East Timor from Indonesia

TERRITORIAL ALLOCATION

The territorial allocation represent the primary step in the development of international boundary that involves division of the territories among the concerned player either by peaceful means or by the use of force.

In the peaceful territorial allocation, purchasing the territory has evolved as the potential way with USA purchasing Arizona & New Mexico from Mexico in 1854 and Alaska from Russia in 1857.

The arbital award or quasi-judicial settlement represents the methods of territorial allocation that involves international mediation. Originally it involved big range of provisions as mandates, protectorates, trusteeships..

However with increasing controversies in regards to such adjustments leading to the annexation of territories by the trustees, it presently restricts itself to dispute solving b/w the countries. Among the significant examples, arbital award of 1884 granting the benefit of territory to USA in the change of ~~shift~~ course of River Rio Grande; 1926 arbital award transferring Mosul (richest crude oil producing region, on shore) in Iraq from Turkey; and 1968 Kutchchh Tribunal awarding 320 sq. kms of area of salt marshes to Pakistan, represent such territorial allocations. The public opinion or PLEBICITE, though formally has been part of potential means of territorial allocation, has come

into utilisation with carving out of East Timor from Indonesia with UN supervised polls. Carving out of South Sudan from Sudan further reestablished plebicite as a valid method of territorial allocation.

The forced territorial allocation involve armed annexation of territories which completely lacks in requirement of the subsequent steps of development of international boundaries. Among the prominent examples with geopolitical reference in the contemporary profile, armed annexation of Manchuria, Paracel & Spratly Islands by China; Ryukyu Is. by Japan; Frank Joseph land by Russia; Falkland Is. by UK & Pakistan Occupied Kashmir by Pakistan, are included.

Facebook Group: Indian Administrative Service (Raz Kr)

DELIMITATION & DEMARCATION

Following territorial allocations, the step called Delimitation is applied, That involves rational discussions on geographical feasibility, political stability of negotiated international boundary, which is largely followed on by signing up of treaty or political agreement. Delimitation paves way to Demarkation that is actual areal implementation of negotiatid boundaries. In demarcation of international boundary, of African countries, territorial allocations & delimitations were completely avoided. Following the two steps, demarcated boundary continues to project the possibilities of subsequent change.

Facebook Group: Indian Administrative Service (Raz Kr)

* INDIAN STATE REORGANISATION

The intranational boundaries like international counterpart represents dynamic characteristics depicting evolution of cultural economic identities in the region. Indian states reorganisation in the similar frame can be classified into 3 well-demarcated phase :=

(i) Phase of consolidation
(ii) Phase of linguistic reorganisation.
(iii) Phase of economic recognition

(i) Phase of consolidation :
At the time of independence >40 % of Indian territory was under the domain of princely states, incorporating variable levels of autonomy. Consolidation of political territory of the country formed the initial & most challenging phase of states reorganisation. Deptt. of states largely applying plebicite (public opinion), consolidated the map of the country with

Facebook Group: Indian Administrative Service (Raz Kr)

scattered troubling points of Junagadh, Hyderabad and J&K. With slight delay & negotiations Junagadh & Hyderabad was annexed in the country. Though with the armed annexation of part of J&K by Pakistan & intervention of UN Security Council Since 1951, Pakistan-Occupied Kashmir & LoC continues to project geo-political tussled location for India & a failure of the phase of consolidation.

(ii) State Reorganisation : LINGUISTIC CRITERIA

The Linguistic Reorganisation of Indian states formally marked its beginning in 1956. Genesis of the public demand toward states' reorganisation on the basis of language, however, is traced back to India's struggle for independence, where with the objective of inducing grassroot momentum against the Britishers, language/ dialect was being given priority. This made language attain political recognition generating regional consciousness. 'non- divisive type' within the country. However, after attainment of independence the economic & cultural dis-locations caused due to political partition, the central administration attempted all the potential ways to

Facebook Group: Indian Administrative Service (Raz Kr)

sideline the demand for states reorganisation on linguistic lines. However, in the outcome of major mass demonstrations for the demand of separate statehood for Telugu speaking areas as A.P., the State's Reorganisation Commission outlined the recommendations resulting into 1956 States' Reorganisation setting in 2nd formal phase of reorganisation of states of the country. This linguistic reorganisation phase apart from including genesis of Telegu speaking A.P. with simultaneous development of Tamil speaking T.N. included the following changes :=

(i) Telangana was carved out from Hyderabad and was merged with A.P.

(ii) Kerala, the Malayalam-speaking state, was created by merging Malabar district of old Madras Presidency with Travancore (i.e. Kochi)

(iii) Kannada-speaking areas of Bombay,

Madras, Hyderabad & Coorg was added to Mysore.

v) Bombay was significantly enlarged by adding Kutchchh and Saurashtra along with addition of Marathi-speaking areas of Hyderabad.

1956 Act facilitating linguistic reorganisation marked its continuation with strong consistent demand of division of Bombay & Punjab on linguistic lines. With the resolution of status of Bombay, the fort city, it was in 1960 that Bombay Presidency was bifurcated into Gujarati-speaking Gujrat & Marathi-speaking Maharashtra. The division of Punjab on linguistic lines was strongly delayed due to the demand of divisions on the basis of 'Gurumukhi'

as well. It was in 1966 ~~that~~, when Akali Dal scrapped the demand of Gurumukhi consideration that Hindi-speaking Haryana was carved out from Punjabi-speaking Punjab as the last linguistic reorganisation. Simultaneously, Pahari-speaking Kangra was annexed to H.P. which was given the status of UT along with the development of Chandigarh as common capital to Punjab & Haryana with status of UT.

(iii) ECONOMIC CRITERIA :

From the beginning of 1970s, dynamism of political boundaries in the devp. of economic and cultural identities marked continuation of states' reorganisation predominantly on economic lines. To begin with, elevation of political status from being UT to the state of Indian Union : H.P., Meghalaya, Manipur, Assam and Tripura formed the examples, following which in the

decade of 1980s, MZ, A.P. and Goa marked the similar elevation on economic criteria. In addition to it, year 2000 representing the bifurcation of 3 existing states resulting in UK, CH & JH depicts the economic considerations though in the different parameter than the preceding cases. This phase of states' reorganisation traced from early 1970s includes only one deviative development as Sikkim, the original protectorate of the country, becoming part of Indian Union based on the public opinion in 1975. With the final decision on Telangana, interrupted sequence of states' reorganisation continues in the country with range of such demands depicting variable levels of struggle identified in the country as demand for Vidarbha, Bodoland, Gorkhaland, combining

both economic & cultural considerations.

GEO-POLITICAL IMPORTANCE OF INDIA WITH/AND NEIGHBOURING LAND/WATER FRONTIERS

Geopolitical importance or sensitivity largely correlates to locational characteristics of a state which in addition involves resource and political dimensions. Indian geopolitical sensitivity is largely reflected in:

(i) Tussled space relation with the neighbours
(ii) Failure of SAARC
(iii) Geopolitical importance of Indian Ocean
(iv) Regional manifestations of India and China.

(1) TUSSLED SPACE RELATIONS:

Indian land frontier is of > 15,000 kms. involving most of the countries that have been part & parcel of Indian political or cultural category till very recent past. This lengthy land frontier primarily includes 6 countries with which

ndia involves variable degrees of territorial concerns. In the significance order of the nature of disputes: Pakistan, China and Bangladesh represent major examples with minor disagreements in reference to Nepal. India - Pakistan 'fault-line' is ~ 3300 kms in length which denotes the strongest cause of tension b/w the two neighbours multiplying geopolitical sensitivity. In Punjab, Rajasthan, Gujrat & some parts of J&K international borders is clearly demarcated. The nature of border disputes primarily correlates to:

a) POK and
b) Sir Creek.

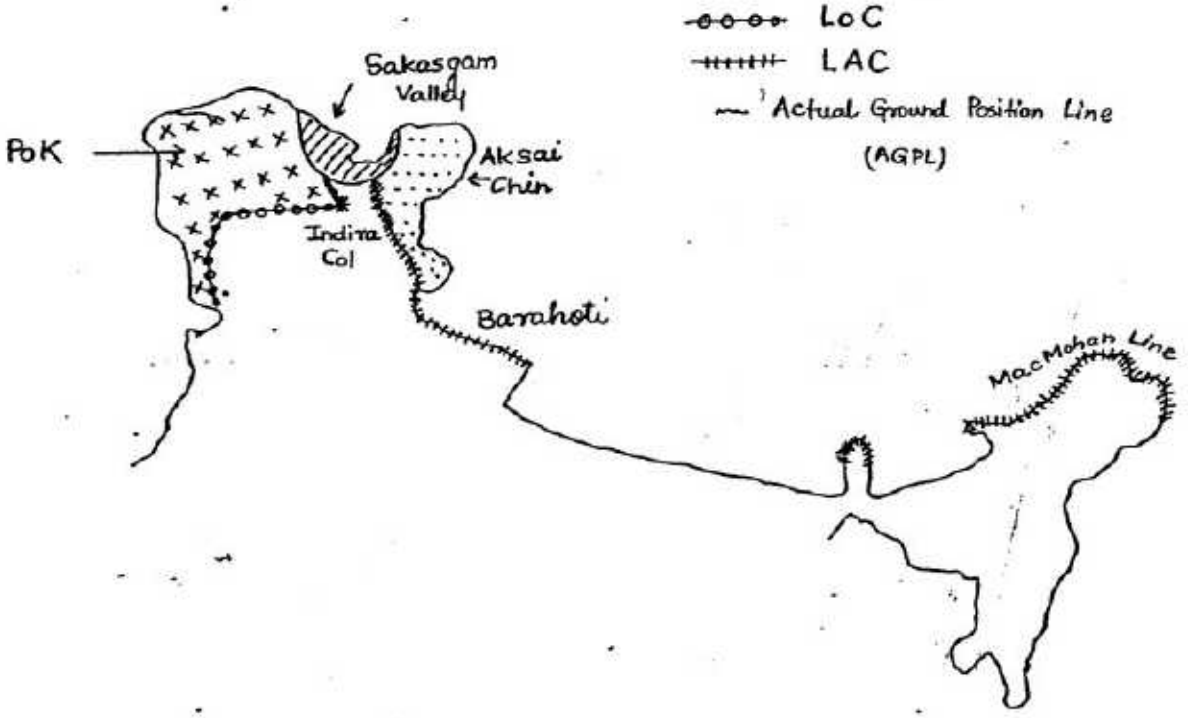

PoK is largely NW^n part of J&K which was forcefully annexed by Pakistan with demarcation of LoC since 1951 with intervention of UN Security Council. While most of J&K represents the influence of territorial disputes, it is

740 kms of LoC that is of the major territorial significance for both the countries. From the northern-most point of LoC called INDIRA COL, lies Siachen Glacier which involves actual ground position line demarcating the two sides. In the PoK, approx 5000 kms-squared of Sakasgam Valley, ceded by Pakistan to China in 1963, have added to the territorial dispute. In regards to navigable Sir Creek, which marks the presence of international boundary between India and Pakistan since 1968, the quasi-judicial settlement ordered by Kutchchh tribunal is not agreed upon by Pakistan. The region apart from being strategic in its location correlates to few of the richest Pliocene-Pleistocene sedimentary constructs with crude oil and natural gas assests.

India-China

The land frontier b/w these 2 neighbouring countries is ~3500 kms depicting largely peaceful profile. This line of actual control b/w the 2 sides is not a final international border & the negotiations b/w the 2 countries have not resulted into any major breakthrough. The LoAC runs from J&K, Uttarakhand to Sikkim & Arunachal Pradesh with the territorial concerns correlating to J&K, UK and Ar. P. In J&K, apart from illegally occupying 35000 sq. kms of area of Aksai Chin, China is also in possession of 5000 sq. kms of area of Sakasgam Valley. In Uttarakhand, towards the northern boundary of Gangotri Glacier, China is in possession of Barahoti Plains. In Arunachal Pradesh, MacMohan Line depicting the international boundary since the British rule

is consistently declined by China as international boundary as it recognises Arunachal Pradesh as Chinese territory in tune to 1962 invasion, annexation and self-decided retreat. In addition to these actual territorial tussles, <u>Sikkim</u>, the integral part of Indian Union is consistently outlined by China as illegitimate area annexation by India.

India - Bangladesh & India - Nepal :

India - Bangladesh territorial tussles primarily correlates to demarcated international boundaries that is lengthiest (4100 kms) international boundary with a country in India. This highly porous boundary has been the main cause of spatial tussle b/w the countries in terms of uncontrolled illegal immigrants. The actual territorial trouble correlates to New Moore Islands & Char Region.

New Moore Islands are aggradational islands identified in territorial waters of India along absolute international boundary b/w the 2 countries. As integral part of India, these islands are counter-claimed by Bangladesh.

Similarly fertile alluvial lowlands of some 300 sq. kms of area developed by distributary of R. Padma called Char is in West Bengal, with Bangladesh having its

claim on it. The territorial disputes have been slightly resolved with the beginning of enclave swapping b/w the 2 countries to correct the anamolies generated at the time of political partition of the country.

With Nepal, some 1700 kms of Indian land frontier involves disagreements in regards to river-water sharing, predominantly R. Kosi & that includes its source from China & R. Kali (R. Sharda). The nature of disputed borders are considered to be both the cause & symptoms of tensions b/w the big S. Asian countries multiplying geo-political sensitivity.

(2) FAILURE OF SAARC :-

South Asian region is identified to be projecting worst combination of poverty, ethnic conflicts, sectarian violence, economic unrest, terrorism, maoist movements along

with being a nuclear war prone zone. This combination by itself makes south Asia highly sensitive region from geopolitical perspective. This region is also recognised to be absolute INDOCENTRIC from all the concerned perspectives of size, popln, resource or economic achievements. It was in beginning of 1980 that the beginning of initiative to discover common challenges & prospects and create climate of harmony that South Asian Association for Regional Cooperation (SAARC) was being negotiated. In year 1985, SAARC was formally launched with all South Asian countries as its members. In year 2005, incorporation of Afghanistan as a formal member along with USA, S. Korea, Japan, China and European Union as Observer

states enlarged the domain of SAARC. Geopolitical significance of South Asia is primarily analysed in the reference of achievement of SAARC. The development of this association is informally categorised into 3 chronological phases:

PHASE 1 (B/w 1985 to 1995): depicted the genesis phase of SAARC, largely characterised with development of institutional network, recognition of cooperation in non-controversial area with the phase largely involving strong prevailing distrust b/w the big participants (India & Pakistan).

PHASE 2 (B/w 1995 - 2005) - Reflected the formal programming of SAARC, largely benefitting from end of cold war, developed institutional infrastructure & formally demarcated areas of action. It was in this phase that progressive

program of SAARC — SIPA (SAARC's Integrated Program of Action) was initiated.

PHASE 3 : (2005 – till date) :=

Incorporation of Afghanistan as a formal member to SAARC highlights the characteristics of contemporary phase as it has multiplied 'enlarged interest' of the observers states in the activity of SAARC, which registered further progress in range of 'regional agreements' with India & Pakistan carrying on the trend of alternating sequence of conflicts & reapproachments.

The developments since SAARC justifying its success as regional cooperation association includes :=

(a) SIPA
(b) Regional Agreements.

SIPA

The integrated program of action is the attempt of SAARC nations to mobilise cooperation in diversified fields. It includes audio-visual exchange programs, chamber of commerce & industry, association of members of Parliaments, association of documentation & association of integrative law and order. All the programs of SIPA was launched during post-Cold War phase, which marks its continuation even in present perspective.

b. REGIONAL AGREEMENTS

In the contemporary phase primarily traced from 2005 range of regional agreements were either incorporated or enlarged for the member countries of the region. Among the important examples SAARC's food security agreement, regional convention on supression of terrorism, convention on promotion of child welfare, regional agreements towards controlling women & drug trafficking & regional convention towards greener south Asia — are included. All these regional agreements barring the exception of suppression of terrorism is advocated to be in progressive domain calering the objectives of the association. On the economic front, regional agreement from South Asian Preferential Trade Arrangements

Facebook Group: Indian Administrative Service (Raz Kr)

Facebook Group: Indian Administrative Service (Raz Kr)

(SAPTA) being enlarged as South Asian Free Trade Area (SAFTA), further reveals significant dimension of progress. The Association however has failed to generate common consciousness & political will to generate a consolidated politico-economic block as other regions of world have successfully attempted. Among the factors that are outlined to be the cause of failure of this association, beaureacratic hurdles, sub-regional arrangements, economic infrastructure and lack of positive leadership are included. Beaureacratic hurdles represent the primary cause in the failure of generation of desired political will to generate cooperative existence. Since globalisation, all the members of association though

Facebook Group: Indian Administrative Service (Raz Kr)

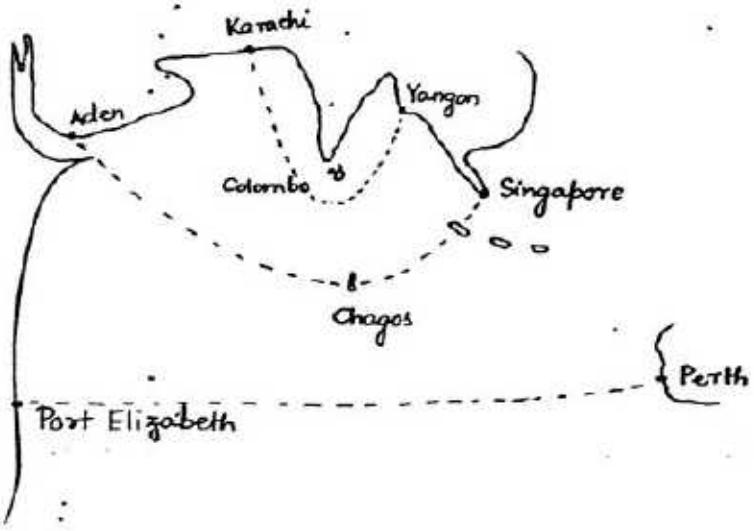

have registered impressive economic growth compared to their 'original capacity, it is that all the countries have compromised regionalism to attain globalism which led to the restricted possibilities of economic consolidation of the region. Secondary status provided to economic regionalism in turn is correlated to the major economic disparities, absence of complimentality, range of tariff barriers along with infrastructural bottlenecks with Indian Look East Policy & multiplication of economic benefits & Pakistan's consistent western policies have paved way to 'more competing rather than complimentary economic interdependence among the two major players. In the background of all these

factors India is reluctant to generate & take the responsibility of leader of the association which is marking its movement in unspecified course in the absence of positive leadership mindset.

GEOPOLITICAL SENSITIVITY OF INDIAN OCEAN

The 3rd largest ocean of the world Indian Ocean forms the only example of continent ocean of the world as it is bounded by land on three sides which makes it half ocean of the world as well. Historically, Indian Ocean has been recognised to be isolated or passive type of ocean from geopolitical parameters. It was primarily due to the fact that since the colonial regime marked its beginning, Britishers recognising the importance of this ocean attempted to generate complete control over it. Such was the

naval capacity built up that for >150 years Indian Ocean continued to be considered as British Lake. 3 specified marine links extensive from Karachi to Yangon, Aden to Singapore & Port Elizabeth to Perth completely regulated the Ocean with Colombo being the HQ of the British Lake.

Post 2nd World War, beginning of the end of colonial regime initiated the compulsion for retreat of British Naval fleet from the Indian Ocean territory, as its former colonies were continuously attaining political independence. The <u>delayed</u> process of

retreat of British forces by the beginning of 1960s created geopolitical vacuum in this ocean. as most of the new independent RIM-COUNTRIES were neither capable of nor were interested in mobilising political edge in Indian Ocean region. It was therefore that the neglected ocean in the lengthiest part of modern geopolitics suddenly became geopolitical pot-boiler. Uncontrolled deployment and enlargement of submarine capacity, naval fleets by all the major political players of the time marked the evolution of geopolitical significance of Indian Ocean. With UN Security Council's intervention on the request forwarded by newly independent rim countries Indian Ocean was declared Zone of Peace leading to immediate halting of deployment of naval capacity & creating the compulsion for

retreat of all installed capacities in time-bound manner. Barring the exception of British Indian Ocean territory, UN Convention on Laws of Seas-related maritime zonations marks its application in the ocean. However, it was the decade of 60s that highlighted 'Indian Ocean Region', the vast mass of land and sea, to be highly significant from geopolitical perspective. The causes of geopolitical significance is prominently classified as:

(I) Rich resource base
(II) Maritime trade routes
(III) Strategic position
(IV) Geopolitically sensitive S. Asia.

Resource Base

Saudi Arabia, the leading producer of crude oil in world with richest proven reserve of crude oil in world readily justifies the economic and strategic significance of Indian Ocean. This importance is multiplied with

with the fact that entire Persian Gulf region is justified to be most dominating source of entire sea line of communication and pipeline network for crude oil, petro-products along with storage and redistribution. As per WTO, it is via Indian Ocean Region that >50% of crude oil trade is correlated with maximum tonnage of transfer on daily basis. In addition dominating status of India in the proved reserves of natural gas in both on- & off-shore locations in BoB multiplies the nature of existing resource base. In the energy resource category, entire N^{n} basin of Indian Ocean depicts the potentiality of substantive tidal-energy harnessing as per regular development of amphidromic systems. The resource richness also includes diverse aquatic habitat

providing maximum range of planktonic and nectonic food resources with substantially proven global markets. Along with it, precipitate extraction (manganese nodules), evaporite production (sodium chloride) adds to the resource richness, thus, geopolitical importance of Indian Ocean.

(ii) Indian Ocean Region as a transitional oceanic region between Pacific and Atlantic Ocean depicts its economic thus geopolitical significance in being correlated to important entry and exit points of the global marine trade routes including Suez Canal, St. of Malacca, Hormuz Strait, Bab-el-Mandeb, Lombok Strait. These entry and exit points of Indian Ocean strongly correlates to maximum of global trade networking between western and eastern countries which multiplies its prominence in the dominating geographical position & economic capacity of

India. Significance of trade route is justified with the fact that seaport infrastructure development and related development of navigable maritime routes is attracting highest investment in Indian Ocean Region with most aggressive player being China. Towards the southern part of Indian Ocean, & Cape of Good Hope makes another important established maritime trade link b/w Africa & Far East.

) Strategic Location

The strategic location of I. Ocean multiplying its geopolitical significance involves its proximity to rim-lands along with most prominent locations in the projected nuclear warfare along with the potential utilisation of inter-continental missile technology. It is this strategic location that reveals significance of maintenance of naval fleet capacity by USA in Diego Garcia, the island in Chagos archipelago of British

Indian Ocean Territory. Moreover, enlargement of the naval capacity in the Persian Gulf region where ever China involves the deployed naval fleet as its strategies against pirates of Indian Ocean Region.

* REGIONAL MANIFESTATIONS

China & India:

The prominent market economies of the world - China & India represents aggressive regional manifestations that are identified to be their respective attempts to attain resource security as well as mark the depiction of their interior temptations on economic from. In terms of resource security competitive hunt by both India & China for mineral and energy resources outside their political domain have resulted in development of new regime of dependency on external natural resource base for sustaining internal economic growth. The scale at which both these countries are

engaged in competitive hunt for resources it is largely inevitable that both are enlarging economic sensitivity towards each other resulting in enlargement of geopolitical sensitivity. Additionally, with both the country over-emphasizing on non-market mechanism to ensure resource security, they are projected to be increasing their economic imperial temptations with consistent shedding of 3rd world attitude specifically in context of African continent multiplying sensitivity towards each other.

* Indian Profile

Indian regional manifestations is largely reflected in :

(i) Indian Diamond String

(ii) Indian Anti-Piracy Attempts

(iii) Indian Look-East Policy.

DIAMOND STRING

The Diamond String of India involves multi-modal transit-transport link developed in participation of India involving rail route roadways navigable waterways & sea-port development. India is developing missing links to Trans-Asian Rail Route along with being the participant of Asian Expressway interlinking all the major SE Asian cities with Dhaka-via Kolkata-to Delhi. Additionally India is BOOT participant in the commercial mobilisation of Sittwee Port Myanmar along with enhancement of navigability of Kaladan River to facilitate link with Indian maritime routes as well as land routes via Mizoram.

ANTI-PIRACY

In the view of increasing threat of Somali pirates, strategically mobilised anti-piracy movement marked the beginning of anti-piracy patrol by Indian Navy Warships since 2008.

Under this Patrol, merchant ships are escorted by the naval warships along entire length of 490 nautical miles of internationally recommended transit corridor. Relating to G. of Aden, this transit corridor involves presence of Chinese warships as China marks the anti-piracy movement involving the development of SHADE MISSION i.e. Shared Awareness And Deconflict among the G. of Aden countries reflecting Indian isolation.

LOOK EAST POLICY

1991 India initiated Look East Policy which is identified to be attempt of India to counter balance dominating stand of China in the region. India presently forms the member of ASEAN regional forum and East Asia Summit. In addition, BoB initiated for Multisectoral Technological And Economic

Cooperation (BIMSTEC) and Mekong-Ganga Cooperation are the Indian instruments in ASEAN enlarging Indian presence in the region. In addition strategic empowerment of A&N Islands involving establishment of tri-services (army, airforce and navy) in A&N Command, regular engagement with ASEAN for joint security drills is enhancing Indian strategic presence in the region of Chinese dominance.

Chinese Regional Manifestations:

These are prominently depicted in selective and ever-increasing presence of China along both Indian water frontier and land frontier. The water frontier presence popularly referred as String of Pearl is the Chinese Sealines of Communication that is extensive from HongKong to Port Sudan incorporating Sl. of Malacca, St. of Hormuz, Bab-el-Mandeb all the major

gold uranium and water resource. Entire mining & other developmental infrastructure is enhancing Chinese connectivity to natural gas rich Central Asia which further avails strategic significance to China in the light of increasing Indian economic presence & pipeline (TAPI) and strategic presence as first formally declared strategic partner of Afghanistan.

Geographical Basis of Indian Fedrn

and

Causes of Regional Consciousness

Geographically India qualifies to be the example of big and diverse country which mark the requirement of representation of every region community into the nodal political or economic setup. Geographical basis of Indian federation therefore derives its characteristics from the diversity India correlates to. the causes of diversity includes :

(i) Physical factors that includes geographic size relief diversity, diversity in prevailing climate geological structure & soil.

ii) Demographic factors that includes diversity in demographic size demographic stage age-sex composition, ethnicity societal characteristics, linguistic and religious diversity

(iii) Economic factors that includes diversity in natural resource base with variations in levels of mobilisation, diversities in agro-climatic conditions with variations in agricultural

typologies with crop-livestock combination, diversity in the capacity of developed manufacturing capabilities both in terms of scale and the output along with diversity in the levels of diffused transport and communication infrastructure.

REGIONAL CONS

In the big diverse country like India, regional consciousness reflects the integral part of Indic Cultural identity. For all the practical purposes as this consciousness reflects 'place-belongingness' is perceived to be politically legitimate and geographically inevitable characteristic. Fundamental causes of evolved regional consciousness includes

i) Physical Factors
ii) Demographic
iii) Economic
iv) Multi-party Democracy with ever increasing number of regional political parties. Requirement of regional political party for this largest functioning democracy is related to reflecting grassroots aspirations and growth potentials. It is however that the mobilisation of political orientations

outlined by such regional political parties is causing injection of 'adverse' regional consciousness that can work against national integration. For the short-term political mileage regional political parties are purposefully enlarging dem- of 'frontiers' in the country. Technically such frontiers are classified to be both divisive and non-divisive. Practically in India, enlargement of regional consciousness by regional parties presently depicts non-divisive frontiers but have been the cause of big range of social unrest, economic turmoil which projects variable magnitude of challenge to the integration of the country..

CAUSES OF NATIONAL INTEGRATION

Demographically 2nd largest country of the world depicts more challenging geographical characteristics than that of China the most populous country because of the persisting diversities. Inspite of these diversities, India represents significantly united and prominently

progressive democratic setup due to the regulating effects of :-

(i) Unitary Physiography
(ii) Unitary Climate
(iii) Unifying economic activities with transportation nodes
(iv) Unifying Indic cultural Identity
(v) Unitary Constitutional Provisions.

INDIAN SECURITY CONCERNS

Geopolitically sensitive India apart from incorporating big range of factors reflecting its political importance & strategic vulnerability reveals security concerns as a major parameter of geopolitical planning & procedures in present perspective. The security threat faced by the country is primarily classified into

i) Terrorist threat
ii) Left Wing Extremism

TERRORISM is formally traced back to the decade of 70s when it was mainly less organised tactic adopted by part of territorial nationalism to obtain specific political objective. It was

therefore well confined within regional boundaries, had very well defined economic & political obj and had highly selected rare acts of violence. The modern terrorist activities on the other hand depict highly complex setup which is linked to diverse ideological religious & political goals/ objectives which involve unnecessary violence as its integral part. Moreover, it involves trans-national extension with deliberately involved unpredictability of action. Modern terrorism, therefore, has been identified to have created sense of vulnerability, gaining attention and publicity along with gaining support from similar ideological groups.

FACTORS

The terrorist activities evolving as global phenomena with ever increasing destructive capacity generation is correlated to few major factors identified in global perspective:=

① Technological advancement specifically in terms

of communication links has been the primary factor in the devp. of global reach of terrorist activity. Information processing and communication progress have favourably diverted non-weapon techniques like cell-phones, internet towards destructive ends. In addition, technological advancement is also reflected in development of more sophisticated powerful yet smaller terrorist weapons.

(2) The terrorism apart from becoming more lethal is becoming more layered in terms of involved leadership & membership. Present terrorist groups are more diffused in their structure with significant increase in sleeper cells. Added to it, lack of well-defined organisational setup readily helps them in avoiding easy identification.

(3) State-sponsorship: over the years there has been consistent increase in the state-sponsorship to such terrorist organisations wherein the governing state regime have promoted

sub-state actors as element of state power justifying their actions on religious or radical lines.

4) Modern terrorism is largely driven by extreme sense of fundamentalism and ideological learning. The nodal identity for which preaches that death is less price to pay.

5) Bad governance, lack of existence of social services, prevailing deprivation are largely punctuating into sense of injustice adding to the bulk of anti-administration ideologies & actions.

In India, terrorist threat is correlated to immediate post independence time-frame. India is projected to be the example of the country that has been subjected to intense and continuous assault as cross-border terrorism. Chronologically beginning of this religious insurgency is traced back to increasing capacity of J&K

Liberation Front in J&K. Over the years this group has been marginalised in favour of more radical groups like LeT which became violently active and adopted terrorist activities with involvement of Pakistan. By the beginning of 1980s, Afghani Jehad Movement marked the beginning of strong link b/w terrorist activity in S.Asia and Afghanistan enlarging its domain in global perspective. This present pattern of terrorist threat is largely correlated to trans-national terrorist grouping rather than being absolutely correlated to Pakistani Islamist Jehadi Organisations. This enlargement of interlinks is projected to be the act of agression against the Indian State To counter-balance this ever growing threat India project the development of big range of agencies as well as comprehensive national laws on terror. Among the important agencies mobilised in counter-terrorist activities

Research And Analysis Wing (RAW), External Intelligency Agency form the major players in gathering cross border information about anti-state activities.

The intelligence bereau - a division of Home Affairs Ministry on the other hand is responsible for gathering info about anti-state activities within the country. Apart from these 2 nodal agencies - a joint committee analyses the intelligence information collected from RAW, IB & military intelligence agency. In addition, the newly formed Defence Intelligence Agency coordinates intelligence inputs from armed forces inter-acting with concerned ministry that are dealing in national security concerns.

Apart from these prime agencies, secondary agencies developed in the country

includes special security forces to guard high profile targets & specially trained National Security Guards for terrorism like situation as hostage crisis. Range of paramilitary forces as Central Reserve Police Force, Central Industrial security Force, BSF are also involved in the networking of agencies. Inspite of such agency structure as Law and Order falls in the domain of state jurisdiction, it is Police Force that are first to respond to such terrorist attack with the participation of Central Paramilitary Forces only as per the requirement proposed by concerned state govts. On the strong realisation that terrorist attack is the attack on national security & integrity with Central Response Team to be involved as Integral part of counter-terrorism activity. Stronger edge to bear with such insurgent condition involves the federal setup of

anti-terrorism unit modelled on the National Counter-Terrorism Centre functioning in USA which however is opposed by state govts. as the threat to their administrative independence or freedom. The incorporation of NIA (National Information Agency) after 2008 Mumbai Terror Attack formally empowers the agency to deal up with terror across India without special permission from states.

LEFT-WING EXTREMISM

The second prominent threat to Indian Security is correlated to left-wing extremism, which is referred to be internally generated, thus, has grave effect on the security concerns of the country.

Chronologically, genesis of LWE is divided into:

i) Naxal Movement

ii) Maoist Movement

iii) LWE

The Naxal Movement is traced back to late 1960 when the farmers of Darjeeling District at Naxalbari initiated the movement to showcase their problems relating to the local landlords and the concerns of their livelihood security. This genesis of Naxalism marked its formal recognition in 1969 with CPI (Marxist) initiated radical support to such movement in 2 different hooks & corners of the country to minimise the suffering of the grassroot poplm The genesis of maoist movement represent the organised grassroot momentums with slowly but steadily proclaimed its mission as physical assault of class enemies which started evolving law & order trouble prominently in WB & Telangana. Decisive phase in maoist movement is outlined in year 2004 which marked the merger of Peoples' War Group & CPI(Maoist) making it

enlarged militant-group that initiated the actions against the state to fulfill their sectarian, violent and divisive agenda.

Year 2009 formally marks the beginning of LWE with Govt. of India banning CPI(Maoist) under Unlawful Activities Prevention Act as a terrorist organisation. This organisation was charged with running extortion economy largely from mining companies along with following destructive policies against administration & administrative setup. This present LWE is absolutely expansive in >170 Districts spreading over 16 States that extends from Nepal-Bihar Int'l Boundary to Kerala-Karnataka inter-state border recognised as RED CORRIDOR.

The causative factors that have resulted in the development of grave dimension of LWE is largely classified into :

(i) Lack of Development

(ii) Non-addressal of Legal Concerns

(iii) Ad hoc policies for Combating LWE

Lack of Development makes the most primary cause that has generated grassroot people readily responding & participating in the anti-state extremism. Thousands of villages in the country in the LWE areas are near completely deprived of connecting roads, drinking water supplies schools, hospitals, post offices police stations making the areas near totally lacking in evident administration. Among the legal concerns, the forest law & the land ceiling act oriented towards safeguarding basic rights of tribal & rural poor have largely

not been addressed at the grassroot level. The Fifth Schedule of the Constitution provides the provision that governors of the state would administer tribal areas by appointing Tribal Advisory Councils. Similarly, in accordance to 9th Schedule that incorporates the clause of equitable distribution of cultivable land by enacting Land Ceiling Act and distributing surplus land among landless labourers are traced back to 1950s with only 3 states J&K, WB and KR having implemented these constitutional means generating doubt among the grassroot dweller of administration intentions towards protecting their interests. This doubt has been multiplied with 'ready encroachment of MNCs' in the native areas of these grassroot popln by readily acquiring mining rights.

The Combat strategies in the absence of clear national policy and thus lack of coordination b/w different agencies and the forces depicts adhoc orientations facilitating substantive encouragement for the nurturing & growth of LWE.
